

项目名称: code-parent

构建工具: maven

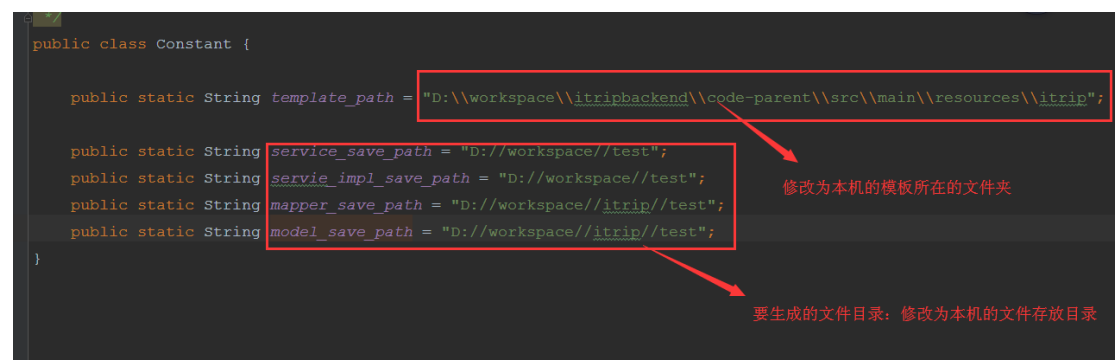

使用方式:

1. 修改 database.properties 配置文件中的 JDBC-URL、userName、password

```
driver=com.mysql.jdbc.Driver
url=jdbc:mysql://192.168.9.44:3306/itripdb?useUnicode=true&characterEncoding=utf-8
user=root
password=root
```

2. 修改模板路径和文件生成路径

```
public class Constant {

    public static String template_path = "D:\\workspace\\itripbackend\\code-parent\\src\\main\\resources\\itrip";

    public static String service_save_path = "D://workspace//test";
    public static String service_impl_save_path = "D://workspace//test";
    public static String mapper_save_path = "D://workspace//itrip//test";
    public static String model_save_path = "D://workspace//itrip//test";

}
```

修改为本机的模板所在的文件夹

要生成的文件目录: 修改为本机的文件存放目录

3. 运行程序, 生成代码: 运行 Generator 类 Main 方法

```
Generator.java
* <p/>
* Created by zzshang on 2015/11/12.
*/
public class Generator {

    public static void main(String args[]) throws Exception {
        TableHandler tableHandler = new TableHandler();
        tableHandler.addExceptTable("");
        MvcHandler mvcHandler = new MvcHandler();
        List<Table> tableList = tableHandler.getTables();
        for (Table table : tableList) {
            mvcHandler.executeModule(table);
            mvcHandler.executeService(table);
            mvcHandler.executeServiceImpl(table);
            mvcHandler.executeMapper(table);
            mvcHandler.executeClazzMapper(table);
        }
    }
}
```
